

STAKEHOLDER ANALYSIS

End-to-End Salesforce CRM Transformation

for Customer Operations and Service Management

1.1 Project Charter

1.1.1 Project Overview

GreenGrid Utilities operates within the energy and utility sector and has recently encountered a number of operational inefficiencies caused by the use of fragmented information systems. Customer records, field service activities, and operational tracking processes are currently managed through a combination of legacy applications, independently maintained spreadsheets, and manual administrative procedures.

The absence of a centralized platform has created challenges such as duplicated customer information, slower service resolution cycles, and limited visibility into operational performance. These limitations make it difficult for departments to collaborate effectively and prevent management from obtaining accurate, real-time insights into daily activities.

To overcome these issues, GreenGrid Utilities intends to implement Salesforce as an enterprise-wide Customer Relationship Management (CRM) solution. The proposed transformation will consolidate customer support functions, service operations, and field maintenance activities into a unified platform that serves as a reliable and centralized source of organizational data.

1.1.2 Problem Statement

The existing operational environment does not provide sufficient integration between departments, resulting in disconnected workflows and inconsistent information management. Customer data is distributed across multiple repositories, field service assignments are coordinated manually through phone-based communication, and operational reporting often requires extensive manual effort.

As a consequence, the organization experiences delays in service delivery, reduced process efficiency, and limited ability to monitor performance indicators. Without a centralized CRM platform, maintaining a consistent and high-quality customer experience remains a significant challenge.

1.1.3 Project Scope

To ensure effective project governance and maintain a clear implementation focus, the project scope has been carefully defined. Historical customer and operational data will be transferred into Salesforce using native migration tools, enabling efficient data access while minimizing dependency on external systems.

In Scope	Out of Scope
Centralized management of customer information and profiles	Financial accounting and customer billing systems
Sales activity management and customer relationship tracking	Real-time integration with external third-party applications
Customer support case creation and management through telephone interactions	Customer self-service web applications
Field service scheduling, dispatch management, and technician coordination	Development of custom-built mobile applications

1.2 Stakeholder Identification

Stakeholders include individuals, departments, and external groups that either contribute to or are affected by the Salesforce CRM implementation initiative.

1.2.1 Internal Stakeholders

Executive Management

Senior organizational leaders responsible for strategic planning and performance monitoring. Their primary interest lies in obtaining reliable operational insights to support informed decision-making.

Customer Support Team

Front-line service representatives responsible for handling customer inquiries, complaints, and service requests. They require efficient tools to manage customer interactions and case records.

Field Technicians

Technical personnel assigned to maintenance and repair activities in the field. Their responsibilities involve responding to service issues and updating job completion information.

Sales Team

Employees responsible for acquiring new customers, managing business relationships, and maintaining account information.

IT/System Administrators

Technical specialists responsible for maintaining platform security, managing configurations, and supporting ongoing system operations.

1.2.2 External Stakeholders

Customers

Customers represent the end users of utility services provided by GreenGrid Utilities. Their satisfaction depends heavily on the speed, accuracy, and reliability of the services delivered by the organization.

Each stakeholder category possesses unique expectations, responsibilities, and levels of influence that must be considered throughout the CRM implementation process.

1.3 Stakeholder Analysis Matrix

The following matrix evaluates stakeholders according to their degree of influence over the project and their level of interest in its successful implementation.

Stakeholder Group	Organizational Role	Interest Level	Power Level	Primary Expectations and Concerns
Executive Management	Strategic leadership and corporate decision-making	High	High	Real-time visibility into operational performance, KPI monitoring, and analytical reporting capabilities
Customer Support Team	Customer interaction and issue management	High	Medium	Fast access to customer information and simplified case management processes
Field Technicians	Execution of maintenance and repair activities	High	Medium	Accurate work assignments, structured digital records, and elimination of paper-based processes
Sales Team	Customer acquisition and account management	High	Medium	Centralized customer information and improved data consistency
IT/System Administrators	Platform management and technical governance	Medium	High	Secure system architecture, scalable configurations, and sustainable automation capabilities
Customers	Consumers of utility services	High	Low	Reduced waiting times and faster resolution of service disruptions

1.4 Business Objectives Definition

1.4.1 Defined Business Objectives

a. Improve Customer Service Operations

Enhance the efficiency of customer support activities by reducing the time required to locate customer information and process service requests.

b. Strengthen Data Quality and Consistency

Develop a centralized data environment that minimizes duplicate records and ensures a higher level of information accuracy across departments.

c. Increase Organizational Visibility

Provide management teams with access to timely operational data through interactive dashboards and automated reporting tools.

d. Improve Cross-Department Collaboration

Create a seamless connection between customer service representatives and field maintenance personnel by utilizing a single integrated platform

1.4.2 Success Indicators

a. Reduction in Average Handling Time (AHT)

A measurable decrease in the average amount of time required by support agents to manage customer interactions and service requests.

b. Customer Data Deduplication Achievement

A significant reduction in duplicate customer records and inconsistent account information across the organization.

c. Dashboard Utilization Rate

Increased adoption and regular use of reporting dashboards by management teams for operational monitoring and decision-making purposes.

Conclusion

This stakeholder analysis provides a structured understanding of the individuals and groups involved in the Salesforce CRM transformation project. It identifies their roles, expectations, and influence while establishing the business objectives that will guide future design and implementation activities.

Ensuring alignment between stakeholder requirements and organizational goals is critical to delivering a CRM solution that generates measurable business value and supports long-term operational improvement.
